=====
HACKATHON USER GUIDE - LLM TESTING
=====
```

1. OVERVIEW

```
-----
```

This guide explains how to test the LLM and initialize embeddings during the hackathon.

Everything you need is already in the folder:

Y:\Hackathon\Chennai\Do not delete\

Contents:

- testing.py - Python script to test chat and initialize embeddings

2. USING testing.py

```
-----
```

The testing.py file does the following:

- Tests the model with a simple prompt
- Initializes the embedding model (you can use it for RAG purpose)

...

```
#testing.py
from langchain_openai import ChatOpenAI, OpenAIEmbeddings
import httpx
```

```
client = httpx.Client(verify=False)
```

```
llm = ChatOpenAI(
    base_url="https://genailab.tcs.in",
    model="azure/genailab-maas-gpt-4.1",
    api_key='sk-Dummy',
    http_client=client
)
```

```
embedding_model = OpenAIEmbeddings(
    base_url="https://genailab.tcs.in",
    model="text-embedding-large3",
    api_key='sk-Dummy',
    http_client=client
)
```

)

```
print(llm.invoke("Give me the meaning of life").content)
```

...

3. INSTRUCTIONS

1. Go to the folder:

Do not delete\

2. Copy ONLY testing.py to your local machine.

3. Open testing.py and replace the placeholders with your TEAM API KEY located at:

Y:\Hackathon\Chennai\Siruseri\{team_number}\key.txt

4. Run the file in LOCAL(C:):

```
python testing.py
```

- You will see the LLM response printed.
- Embeddings are initialized and ready for future RAG usage.
- Full RAG is not included to avoid SSL certificate errors.

Reference: <https://stackoverflow.com/questions/76106366/how-to-use-tiktoken-in-offline-mode-computer>

5. If you encounter any errors while running npm install or any other npm commands, please try running the following command and then retry:

```
npm config set strict-ssl false
```

4. GENAILAB API PORTAL

The LLM models are hosted at the Swagger portal:

<https://genailab.tcs.in/>

You can:

- Authenticate using your team API key
- Explore the models endpoints
- See the list of models you can access (23 models in total):
 - Text models
 - Audio models
 - Embedding models

This is useful if you want to test other models beyond the defaults provided in testing.py.

 Do NOT delete or Edit the "Do not delete" folder. It contains all required files.

5. SUMMARY

- Copy testing.py to your local machine.
- Replace your API key.
- Run the script to test chat and initialize embeddings.
- Visit <https://genailab.tcs.in> to explore models and endpoints.
- Use Aider for interactive coding support.
